

TallySol

Split the bill. Settle on Solana.

Solana Mobile hackathon: Clock In · Built for the Seeker · Solo builder

Splitting the bill is easy. Getting paid is not.

Chasing people

Asking one friend at a time, days after the dinner.

Different wallets

Everyone holds something different, so nobody knows what to send.

Ledgers, not payments

Most split apps only keep score. The money still moves somewhere else.

In TallySol, the split is the payment request.

1 · Create

Enter an expense, a USD total and who owes. The share is worked out for you.

2 · Share

Each person sees their share. A Solana Pay QR code is ready to scan in person.

3 · Settle

Pay from your own wallet in the token you hold, converted at live prices.

What works today

Wallet sign-in

Mobile Wallet Adapter, with your address one tap away to copy.

Equal splits

Add people by paste or QR scan.
The organizer counts as a share.

Pay in any listed token

USD shares converted at live prices from a curated token list.

Solana Pay QR

A scannable payment request for each unpaid share.

Who still owes you

A summary on the Split tab, cleared as people pay.

Wallet, transfer, history

Balances, send and receive, and a record of finished splits.

Built for the phone, not ported to it

- Mobile Wallet Adapter for sign-in and every payment
- Camera QR scanning to add a person's wallet address
- One-tap paste from the clipboard
- Solana Pay QR codes for settling in person
- A native Android release APK, tested on a Solana Seeker

SKR unlocks TallySol Plus

Free

- 2 active splits at a time
- SOL, USDC, USDT and SKR
- No SKR needed

Plus

- Unlimited active splits
- JUP, WIF, BONK and PENGU as extra tokens
- Unlocked by holding 1,000+ SKR

SKR is only read, never spent or locked. The balance is checked live on Solana mainnet.

Real Solana transactions, checked on-chain

- SOL and token transfers signed through Mobile Wallet Adapter
- A token account for the recipient is created automatically when needed
- The Plus check reads the SKR balance from mainnet in real time
- Every Plus token was verified on-chain: standard token program, no freeze or mint authority

Working today, and what is still planned

Working today

- Wallet sign-in and payments
- Splits paid in several currencies
- Solana Pay QR codes
- SKR-gated Plus tier
- Release APK tested on a Seeker

Planned

- Push notifications when added to a split
- History export for Plus
- Mainnet release with real USDC, USDT and SKR

To be clear about scope: free-tier USDC, USDT and SKR run as devnet test tokens. The Plus tokens exist only on mainnet and have not yet been tested for sending. Splits are stored on the device, with no backend yet.

Next steps after the hackathon

Notifications

A small backend to sync splits, so people get a push when they are added.

History and export

Expense history and export as a Plus perk for SKR holders.

Mainnet and dApp Store

Real USDC, USDT and SKR mints, then publish to the Solana dApp Store.

Split the bill. Settle on Solana.

Thank you
